Fractal compression - Wikipedia Fractal compression is a lossy compression method for digital images, based on fractals. The method is best suited for textures and natural images, relying on the fact that parts of an image often resemble other parts of the same image. The related fields of fractal image encoding and fractal image analysis have blossomed in recent years. This book, originating from a NATO Advanced Study Institute held in 1995, presents work by leading researchers. AN INTRODUCTION TO FRACTAL IMAGE COMPRESSION An Introduction to Fractal Image Compression 5 This simple looking theorem tells us how we can expect a collection of transformations to define an image. 3. Why the name "Fractal" ... a fractal encoding of "Lena" along with a magnification of the original. 4. How much Compression can Fractal achieve?.

Fractal image encoding with flexible classification sets ... Fractal image compression (FIC) technology is an interesting attempt at structure similarity-based image compression. It has been widely applied in many fields such as image encryption, image retrieval, image sharpening, and pattern recognition. However, overlong encoding time is the main difficulty. A fractal image encoding method based on statistical loss ... The thinking of fractal image encoding was to find the relationship between subsets of the encoding image, and used the parameters of contractive affine transformation as the encoding file. This method had many benefits. Cuckoo inspired fast search algorithm for fractal image ... The high encoding time due to the complex search in identifying the similar blocks in given image is the significant constraint of the traditional fractal image compression, which has the iterated function system (Barnsley and Sloan, 1990) as backbone of the fractal image compression. Hence the decreasing encoding time in fractal image.

Fractal Image Compression - Northwestern University Fractal compression stores this type of information to achieve compression. To do fractal compression , the image is divided into sub-blocks. Then for each block , the most similar block if found in a half size version of the image and stored.
